### Zero as an Exponent

For every nonzero number \( a \), \( a^0 = 1 \).

**Examples**

\[
4^0 = 1 \\
(-3)^0 = 1 \\
(5.14)^0 = 1
\]

### Negative Exponent

For every nonzero number \( a \) and integer \( n \), \( a^{-n} = \frac{1}{a^n} \).

**Examples**

\[
7^{-3} = \frac{1}{7^3} \\
(-5)^{-2} = \frac{1}{(-5)^2}
\]

### Properties Zero and Negative Exponents

#### Zero as an Exponent

For every nonzero number \( a \), \( a^0 = 1 \).

**Examples**

\[
4^0 = 1 \\
(-3)^0 = 1 \\
(5.14)^0 = 1
\]

#### Negative Exponent

For every nonzero number \( a \) and integer \( n \), \( a^{-n} = \frac{1}{a^n} \).

**Examples**

\[
7^{-3} = \frac{1}{7^3} \\
(-5)^{-2} = \frac{1}{(-5)^2}
\]

### Simplifying Powers

**What is the simplified form of each expression?**

**A** \( 9^{-2} \)

\[
9^{-2} = \frac{1}{9^2} = \frac{1}{81}
\]

Use the definition of negative exponent. Simplify.

**B** \( (-3.6)^0 \)

\[
(-3.6)^0 = 1
\]

Use the definition of zero as an exponent.

### Simplifying Exponential Expressions

**What is the simplified form of each expression?**

**A** \( 5a^3b^{-2} \)

\[
5a^3b^{-2} = 5a^3 \left( \frac{1}{b^2} \right)
\]

Use the definition of negative exponent. Simplify.

\[
= \frac{5a^3}{b^2}
\]

**continued on next page**
Problem 2

\[ \frac{1}{x^{-5}} = 1 \div x^{-5} \]

Rewrite using a division symbol.

\[ = 1 \div \frac{1}{x^5} \]

Use the definition of negative exponent.

\[ = 1 \cdot x^5 \]

Multiply by the reciprocal of \( \frac{1}{x^5} \), which is \( x^5 \).

\[ = x^5 \]

Identity Property of Multiplication

Problem 3

Evaluating an Exponential Expression

What is the value of \( 3s^3t^{-2} \) for \( s = 2 \) and \( t = -3 \)?

**Method 1** Simplify first.

\[ 3s^3t^{-2} = \frac{3(2)^3}{(-3)^2} \]

\[ = 24 \cdot \frac{2}{9} \]

\[ = \frac{24}{9} = 2\frac{2}{9} \]

**Method 2** Substitute first.

\[ 3s^3t^{-2} = 3(2)^3(-3)^{-2} \]

\[ = 3(2)^3 \left( \frac{1}{(-3)^2} \right) \]

\[ = \frac{24}{9} = 2\frac{2}{9} \]

Problem 4

Using an Exponential Expression

**Population Growth** A population of marine bacteria doubles every hour under controlled laboratory conditions. The number of bacteria is modeled by the expression \( 1000 \cdot 2^h \), where \( h \) is the number of hours after a scientist measures the population size. Evaluate the expression for \( h = 0 \) and \( h = -3 \). What does each value of the expression represent in the situation?

**Know**

- \( 1000 \cdot 2^h \) models the population.

**Need**

- Values of the expression for \( h = 0 \) and \( h = -3 \)

**Plan**

Substitute each value of \( h \) into the expression and simplify.

**Know**

\[ 1000 \cdot 2^h = 1000 \cdot 2^0 \]

Substitute 0 for \( h \).

\[ = 1000 \cdot 1 = 1000 \]

Simplify.

The value of the expression for \( h = 0 \) is 1000. There were 1000 bacteria at the time the scientist measured the population.

\[ 1000 \cdot 2^h = 1000 \cdot 2^{-3} \]

Substitute \(-3\) for \( h \).

\[ = 1000 \cdot \frac{1}{8} = 125 \]

Simplify.

The value of the expression for \( h = -3 \) is 125. There were 125 bacteria 3 h before the scientist measured the population.

Exponents can also be expressed as fractions. Fractional exponents are called rational exponents.

Recall that $3^2$ means $3 \cdot 3$, which equals 9. You can represent the number 3 using a rational exponent: $9^{\frac{1}{2}} = 3$. The equation $9^{\frac{1}{2}} = b$ indicates that $b$ is the positive number that when multiplied by itself, equals 9.

In general, $a^{\frac{1}{n}} = b$ means that $b$ multiplied as a factor $n$ times equals $a$.

The definition of a negative exponent stated for integer exponents in Lesson 5-1 also holds for rational exponents.

**Problem 5**

**Raising a Number in Scientific Notation to a Power**

**Aircraft** The expression \( \frac{1}{2}mv^2 \) gives the kinetic energy, in joules, of an object with a mass of \( m \) kg traveling at a speed of \( v \) meters per second. What is the kinetic energy of an experimental unmanned jet with a mass of \( 1.3 \times 10^3 \) kg traveling at a speed of about \( 3.1 \times 10^8 \) m/s?

\[
\frac{1}{2}mv^2 = \frac{1}{2} \cdot (1.3 \times 10^3)(3.1 \times 10^8)^2
\]

Substitute the values for \( m \) and \( v \) into the expression.

\[
= \frac{1}{2} \cdot 1.3 \cdot 10^3 \cdot 3.1^2 \cdot (10^8)^2
\]

Raise the two factors to the second power.

\[
= \frac{1}{2} \cdot 1.3 \cdot 10^3 \cdot 3.1^2 \cdot 10^{16}
\]

Multiply the exponents of a power raised to a power.

\[
= \frac{1}{2} \cdot 1.3 \cdot 3.1^2 \cdot 10^3 \cdot 10^6
\]

Use the Commutative Property of Multiplication.

\[
= \frac{1}{2} \cdot 1.3 \cdot 3.1^2 \cdot 10^{3+6}
\]

Add exponents of powers with the same base.

\[
= \frac{1}{2} \cdot 1.3 \cdot 3.1^2 \cdot 10^9
\]

A radical expression is an expression that contains a radical. The expression under the radical sign is the radicand. The number \( n \) in the crook of the radical sign is the index. The index gives the degree of the root. A number \( b \) is an \( n \)th root of a number \( a \) if \( b^n = a \).

If there is no index, the degree is 2, which means square root. A number \( b \) is a square root of a number \( a \) if \( b^2 = a \).

You can estimate the metabolic rate of living organisms based on body mass using Kleiber’s law. The formula $R = 73.3 \sqrt[24]{M^3}$ relates metabolic rate $R$ measured in Calories per day to body mass $M$ measured in kilograms. What is the metabolic rate of a dog with a body mass of 18 kg?

$$R = 73.3 \sqrt[24]{18^3}$$

Substitute 18 for $M$.

$$= 640.5578436$$

Use a calculator to simplify.

The metabolic rate is about 641 Calories per day.

**Problem 4**

**Writing a Radical Expression**

**Art** A rectangular door in a museum is three times as tall as it is wide. What is a simplified expression for the maximum length of a painting that fits through the door?

**Know** The door is $w$ units wide and $3w$ units high.

**Need** The diagonal length $d$ of the doorway

**Plan** Use the Pythagorean Theorem.

$$
\begin{align*}
d^2 &= w^2 + (3w)^2 & \text{Pythagorean Theorem} \\
d^2 &= w^2 + 9w^2 & \text{Simplify} (3w)^2. \\
d^2 &= 10w^2 & \text{Combine like terms.} \\
d &= \sqrt{10w^2} & \text{Find the principal square root of each side.} \\
d &= \sqrt{w^2} \cdot \sqrt{10} & \text{Multiplication Property of Square Roots} \\
d &= w\sqrt{10} & \text{Simplify} \sqrt{w^2}.

The $n$th term of an arithmetic sequence with first term $A(1)$ and common difference $d$ is given by

$$A(n) = A(1) + (n - 1)d$$

Key Concept  Explicit Formula for an Arithmetic Sequence

The $n$th term of a geometric sequence with first term $A(1)$ and common ratio $r$ is given by

$$A(n) = A(1) \cdot r^{n-1}, \text{ for } n \geq 1$$

Key Concept  Explicit Formula for a Geometric Sequence
**Identifying Geometric Sequences**

Which of the following are geometric sequences?

A  
There is a common ratio, \( r = 10 \). So, the sequence is geometric.

\[ \frac{20}{2} = \frac{200}{4} = \frac{2000}{6} = \frac{20,000}{8} = \frac{200,000}{10} = 10 \]

There is a common ratio, \( r = 10 \). So, the sequence is geometric.

B  
There is no common ratio. So, the sequence is not geometric.

\[ \frac{2}{2} = \frac{4}{2.5} = \frac{6}{4} = \frac{8}{6} = \frac{10}{8} = 1.5 \]

There is no common ratio. So, the sequence is not geometric.

C  
There is a common ratio, \( r = -1 \). So, the sequence is geometric.

\[ \frac{-5}{5} = \frac{-5}{5} = \frac{5}{5} = 1 \]

There is a common ratio, \( r = -1 \). So, the sequence is geometric.
Problem 4

Writing an Explicit Formula for an Arithmetic Sequence

Online Auction An online auction works as shown below. Write an explicit formula to represent the bids as an arithmetic sequence. What is the twelfth bid?

Make a table of the bids. Identify the first term and common difference.

<table>
<thead>
<tr>
<th>Term Number, $n$</th>

</thead>
<tbody>
<tr>
<td>Value of Term, $A(n)$</td>
<td>200</td>
<td>210</td>
<td>220</td>
<td>230</td>
</tr>
</tbody>
</table>

The first term $A(1)$ is 200.

The common difference $d$ is 10.

Substitute $A(1) = 200$ and $d = 10$ into the formula $A(n) = A(1) + (n - 1)d$. The explicit formula $A(n) = 200 + (n - 1)10$ represents the arithmetic sequence of the auction bids. To find the twelfth bid, evaluate $A(n)$ for $n = 12$.

$$A(12) = 200 + (12 - 1)10 = 310$$

The twelfth bid is $310.

Problem 5

Writing an Explicit Formula for a Geometric Sequence

A Find the explicit formula for the sequence 7, 21, 63, 189, . . .

The starting value $A(1)$ is 7. The common ratio $r$ is $\frac{21}{7} = 3$.

$$A(n) = A(1) \cdot r^{n-1}$$

Use the formula.

Substitute the starting value for $A(1)$.

$$A(n) = 7 \cdot 3^{n-1}$$

Substitute the common ratio for $r$.

The explicit formula is $A(n) = 7 \cdot 3^{n-1}$.

B Find the value of the 5th term of the sequence.

$$A(5) = 7 \cdot 3^{5-1}$$

Use the explicit formula. Substitute 5 for $n$.

$$= 7 \cdot 3^4$$

Simplify.

$$= 567$$

The fifth term of the sequence is 567.

34. Write an explicit formula for the \( n \)th term of the geometric sequence with \( A(1) = 5 \) and \( A(6) = 160 \).
A recursive formula is a function rule that relates each term of a sequence after the first to the ones before it. Consider the sequence 7, 11, 15, 19, \ldots. You can use the common difference of the terms of an arithmetic sequence to write a recursive formula for the sequence. For the sequence 7, 11, 15, 19, \ldots, the common difference is 4.

Let \( n \) = the term number in the sequence.
Let \( A(n) \) = the value of the \( n \)th term of the sequence.

- value of term 1 = \( A(1) = 7 \)
- value of term 2 = \( A(2) = A(1) + 4 = 11 \)
- value of term 3 = \( A(3) = A(2) + 4 = 15 \)
- value of term 4 = \( A(4) = A(3) + 4 = 19 \)
- value of term \( n \) = \( A(n) = A(n - 1) + 4 \)

The recursive formula for the arithmetic sequence above is \( A(n) = A(n - 1) + 4 \).

The recursive formula together with the starting value \( A(1) = 7 \) defines the sequence.

A general recursive definition for an arithmetic sequence with common difference \( d \) has two parts:

\begin{align*}
A(1) &= \text{first term} \\
A(n) &= A(n - 1) + d, \text{ for } n \geq 2
\end{align*}
\]

Initial condition, or starting value
Recursive formula
Problem 1

Writing a Recursive Formula

Write a recursive formula for the arithmetic sequence below. What is the value of the 8th term?

Step 1

\[ A(1) = 70 \]

First term of the sequence

\[ A(2) = A(1) + 7 = 70 + 7 = 77 \]

\( A(2) \) is found by adding 7 to \( A(1) \).

\[ A(3) = A(2) + 7 = 77 + 7 = 84 \]

\( A(3) \) is found by adding 7 to \( A(2) \).

\[ A(4) = A(3) + 7 = 84 + 7 = 91 \]

\( A(4) \) is found by adding 7 to \( A(3) \).

\[ A(n) = A(n - 1) + 7 \]

\( A(n) \) is found by adding 7 to \( A(n - 1) \).

The recursive formula for the arithmetic sequence is \( A(n) = A(n - 1) + 7 \). The recursive formula together with the starting value \( A(1) = 70 \) defines the sequence.

Step 2

To find the value of the 8th term, you need to extend the pattern.

\[ A(5) = A(4) + 7 = 91 + 7 = 98 \]

\[ A(6) = A(5) + 7 = 98 + 7 = 105 \]

\[ A(7) = A(6) + 7 = 105 + 7 = 112 \]

\[ A(8) = A(7) + 7 = 112 + 7 = 119 \]

The value of the 8th term is 119.

Problem 2

Identifying Terms of Recursive Arithmetic Sequences

Use the recursive definition \( A(n) = A(n - 1) + 10 \) when \( A(1) = 3 \) to find the first five terms of the arithmetic sequence it defines.

The sequence says that 10 is added to each previous term of the sequence and \( A(1) \) is 3.

Writing an Explicit Formula From a Recursive Formula

An arithmetic sequence is represented by the recursive formula \( A(n) = A(n - 1) + 12 \). If the first term of the sequence is 19, write the explicit formula.

The first term is 19, so \( A(1) = 19 \).

\[
A(n) = A(n - 1) + 12
\]

General form of an explicit formula

\[
A(n) = 19 + (n - 1) \cdot 12
\]

Substitute 19 for \( A(1) \) and 12 for \( d \).

The explicit formula \( A(n) = 19 + (n - 1) \cdot 12 \) represents the arithmetic sequence.

Adding 12 to the previous term means that the common difference is 12.

Writing a Recursive Formula From an Explicit Formula

An arithmetic sequence is represented by the explicit formula \( A(n) = 32 + (n - 1)(22) \). What is the recursive formula?

32 is the first term.

\[
A(n) = 32 + (n - 1)(22)
\]

22 is the common difference.

A recursive formula relates the value of the term to the previous term using the common difference. Use \( A(n) \) to represent the value of the term and \( A(n - 1) \) to represent the value of the previous term.

The arithmetic sequence is represented by the recursive formula \( A(n) = A(n - 1) + 22 \). The recursive formula together with the starting value \( A(1) = 32 \) defines the sequence.

Write a recursive definition for each explicit formula.

12. \( A(n) = 5 + (n - 1)(3) \) 13. \( A(n) = 3 + (n - 1)(-5) \)

A geometric sequence with a starting value $a$ and a common ratio $r$ is a sequence of
the form $a, ar, ar^2, ar^3, \ldots$

Consider the geometric sequence 4, 20, 100, 500, \ldots You can use the common ratio
of the terms of a geometric sequence to write a recursive formula. For the sequence
4, 20, 100, 500, \ldots, the common ratio is 5.

value of term 1 = $A(1) = 4$
value of term 2 = $A(2) = A(1) \cdot 5 = 20$
value of term 3 = $A(3) = A(2) \cdot 5 = 100$
value of term 4 = $A(4) = A(3) \cdot 5 = 500$
value of term $n = A(n) = A(n - 1) \cdot 5$

The recursive formula for the geometric sequence above is $A(n) = A(n - 1) \cdot 5$.
The recursive formula together with the starting value $A(1) = 4$ defines the sequence.

A general recursive definition for a geometric sequence with common ratio $r$ has
two parts:

$A(1) = a$ \hspace{1cm} \text{Initial condition, or starting value}$

$A(n) = A(n - 1) \cdot r$, for $n \geq 2$ \hspace{1cm} \text{Recursive formula}$
Problem 1

Writing a Recursive Formula for a Geometric Sequence

Find the recursive formula for the sequence 7, 21, 63, 189, . . .

The starting value \(a(1)\) is 7. The common ratio \(r\) is \(\frac{21}{7} = 3\).

\[
\begin{align*}
A(1) &= a; \quad A(n) = A(n - 1) \cdot r \\
A(1) &= 7; \quad A(n) = A(n - 1) \cdot r \\
A(1) &= 7; \quad A(n) = A(n - 1) \cdot 3
\end{align*}
\]

Use the formula.

Substitute the starting value for \(A(1)\).

Substitute the common ratio for \(r\).

The recursive formula is \(A(n) = A(n - 1) \cdot 3\). The recursive formula together with the starting value \(A(n) = 7\) defines the sequence.

Problem 2

Identifying Terms of Recursive Geometric Sequences

Consider the following geometric sequences:

<table>
<thead>
<tr>
<th>Sequence A</th>
<th>Sequence B</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A(1) = 1)</td>
<td>(B(1) = 10)</td>
</tr>
<tr>
<td>(A(n) = \frac{1}{2} \cdot A(n - 1))</td>
<td>(B(n) = \frac{1}{10} \cdot B(n - 1))</td>
</tr>
</tbody>
</table>

Which is greater \(A(100)\) or \(B(100)\)?

Method 1  
Use real objects to help represent the values of the terms in the sequences.

You can represent \(A(1)\) with a piece of string. Since \(A(1) = 1\) and \(B(1) = 10\), use a string 10 times as long to represent \(B(1)\). Because the common ratio of each sequence is less than one, you can represent the next term of each sequence by cutting off a section of string.

After the first cut to each string, the string representing \(B(2)\) will be longer than the string representing \(A(2)\). After the second cut, the string representing \(A(3)\) will be longer than the string representing \(B(3)\).

In every cut after the second cut, the string representing terms in Sequence B will be shorter than the strings representing terms in Sequence A. This is because you cut away a greater portion of the string for Sequence A than you do for Sequence B.

So \(A(100)\) is greater than \(B(100)\).

For additional support when completing your homework, go to PearsonTEXAS.com.

Write the recursive definition for each geometric sequence.

1. 4, 8, 16, 32, . . .

2. 1, 5, 25, 125, . . .

3. 100, 50, 25, 12.5, . . .

4. 2, −8, 32, −128, . . .

5. −\frac{1}{36}, \frac{1}{12}, −\frac{1}{4}, \frac{3}{4}, . . .

6. 192, 128, 85\frac{1}{3}, 56\frac{8}{9}, . . .

Problem 2 continued

Method 2 Use number sense.

Consider the first three terms of each sequence.

\[
\begin{align*}
A(1) &= 1 \\
A(2) &= \frac{1}{2} \cdot 1 = \frac{1}{2} \\
A(3) &= \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}
\end{align*}
\]

\[
\begin{align*}
B(1) &= 10 \\
B(2) &= \frac{1}{10} \cdot 10 = 1 \\
B(3) &= \frac{1}{10} \cdot 1 = \frac{1}{10}
\end{align*}
\]

Since the common ratio for Sequence B, \(\frac{1}{10}\), is smaller than the common ratio for Sequence A, \(\frac{1}{2}\), Sequence B gets smaller faster than Sequence A.

Note that while Sequence B starts out greater than Sequence A, by the third term, Sequence B is less than Sequence A. And since Sequence B gets smaller faster than Sequence A, terms of Sequence B are less than the corresponding terms of Sequence A for every term after the third term. So \(A(100)\) is greater than \(B(100)\).

Using Sequences

A manager at a clothing store created sequences to show the original price and the marked-down prices of jeans and sweaters in two different ways. Write a recursive formula and an explicit formula for each sequence. What will the price of each item be after the 6th markdown for each sequence?

First Sequence (Jeans) Second Sequence (Sweaters)

\[
\begin{align*}
&\text{Starting prices:} \\
&\$60, \$51, \$43.35, \$36.85, \ldots \\
&\$60, \$52, \$44, \$36, \ldots \\
&\text{common ratio } = 0.85 \\
&\text{common difference } = -8 \\
&\text{Recursive formula } A(n) = A(n - 1) \cdot 0.85 \\
&\text{Explicit formula } A(n) = 60 \cdot 0.85^{n-1}
\end{align*}
\]

\[
\begin{align*}
&\text{Starting prices:} \\
&\$60, \$52, \$44, \$36, \ldots
\end{align*}
\]

\[
\begin{align*}
&\text{Recursive formula } A(n) = A(n - 1) - 8 \\
&\text{Explicit formula } A(n) = 60 + (n - 1)(-8)
\end{align*}
\]

\[
\begin{align*}
&\text{Substitute 7 for } n. \\
&A(7) = 60 + (7 - 1)(-8)
\end{align*}
\]

\[
\begin{align*}
&A(7) \approx 22.63 \\
&A(7) = 12
\end{align*}
\]

Continuing the first sequence, the price of the jeans is $22.63 after the 6th markdown.

6-1 Arithmetic and Geometric Sequences

Quick Review

A sequence is an ordered list of numbers, called terms, that often forms a pattern.

In an arithmetic sequence, the difference between terms is constant and is called the common difference.

In a geometric sequence, the ratio of any term to its preceding term is constant and is called the common ratio.

Example

Write an explicit formula for each sequence.

35, 31, 27, 23, . . .
- This is an arithmetic sequence. The pattern of this sequence is “add −4 to the previous term.”
- The common difference is −4.
- The explicit formula for this sequence is $A(n) = 35 + (n - 1)(-4)$.

3, 30, 300, 3000, . . .
- This is a geometric sequence. The pattern of this sequence is “multiply the previous term by 10.”
- The common ratio is 10.
- The explicit formula for this sequence is $A(n) = 3 \cdot (10)^{n-1}$.

  The exponents are 3 and 2. Their sum is 5.

- **C** 4

- **Campgrounds**: \(-7.1x^2 - 180x + 5800\)
- **Backcountry**: \(21x^2 - 140x + 1900\)

In each polynomial, \(x = 0\) corresponds to the first year in the 5-yr period. What polynomial models the total number of overnight stays in both types of sites?

continued on next page...
Problem 5

Continued

Problem 4

Know

- Overnight stays in campgrounds:
  \(-7.1x^2 - 180x + 5800\)
- Overnight stays in backcountry:
  \(21x^2 - 140x + 1900\)

Need

A polynomial for the total number of overnight stays in campgrounds and backcountry.

Plan

The word "both" implies addition, so add the two polynomials to represent the total.

Method 1
Add vertically. Line up like terms. Then add the coefficients.

\[
-7.1x^2 - 180x + 5800 \\
+ 21x^2 - 140x + 1900 \\
\]

\[
13.9x^2 - 320x + 7700
\]

Method 2
Add horizontally. Group like terms. Then add the coefficients.

\[
(-7.1x^2 - 180x + 5800) + (21x^2 - 140x + 1900)
\]

\[
= (-7.1x^2 + 21x^2) + (-180x - 140x) + (5800 + 1900)
\]

\[
= 13.9x^2 - 320x + 7700
\]

A polynomial that models the number of stays (in thousands) in campgrounds and backcountry over the 5-yr period is \(13.9x^2 - 320x + 7700\).

Problem 5

Subtracting Polynomials

Simplify \((-3x^2 + 5x) - (5x^2 + 3x - 12)\).

Method 1
Subtract vertically.

\[
-3x^2 + 5x \\
- (5x^2 + 3x - 12)
\]

Line up like terms.

\[
-3x^2 + 5x \\
- 5x^2 - 3x + 12
\]

Then add the opposite of each term in the polynomial being subtracted.

\[
-8x^2 + 2x + 12
\]

Method 2
Subtract horizontally.

\[
(-3x^2 + 5x) - (5x^2 + 3x - 12)
\]

Write the opposite of each term in the polynomial being subtracted.

\[
= -3x^2 + 5x - 5x^2 - 3x + 12
\]

Group like terms.

\[
= (-3x^2 - 5x^2) + (5x - 3x) + 12
\]

Simplify.

\[
= -8x^2 + 2x + 12
\]
Find the degree of each monomial.

2. \(8a^3\)  
3. \(20\)

= 4x^2 - 3x^2 - x - 5x + 3 - 6 \\
= x^2 - 6x - 3
\]

Simplify.

17. \(12p + 8p\)  
18. \(2m^n + 9m^3n^3\)

**Problem 1**

**Multiplying Polynomials of Degree One**

**Multiple Choice** What is a simpler form of \(-x(9x + 7)\)?

- A. \(-9x - 7\)
- B. \(9x^2 + 7x\)
- C. \(-9x^2 + 7\)
- D. \(-9x^2 - 7x\)

\[-x(9x + 7) = -x(9x) - x(7)\]
\[= -9x^1 + 1 - 7x\]

The correct answer is D.

**Problem 2**

**Finding the Greatest Common Factor**

List the prime factors of each term. Identify the factors common to all terms.

- \(5x^3 = 5 \cdot x \cdot x \cdot x\)
- \(25x^2 = 5 \cdot 5 \cdot x \cdot x\)
- \(45x = 3 \cdot 3 \cdot 5 \cdot x\)

The GCF is \(5 \cdot x\), or \(5x\).

**Problem 3**

**Factoring Out a Monomial**

What is the factored form of \(4x^2 - 24x\)?

**Think**

To factor the polynomial, first factor each term.

Find the GCF of the two terms.

Use the Distributive Property to factor out the GCF from each term. Then factor it out of the polynomial.

**Write**

\[4x^2 = 2 \cdot 2 \cdot x \cdot x\]
\[24x = 2 \cdot 2 \cdot 2 \cdot 3 \cdot x\]

The GCF is \(2 \cdot 2 \cdot x\), or \(4x\).

\[4x^2 - 24x = 4x(x) + 4x(-6)\]
\[= 4x(x - 6)\]

The factored form of the polynomial is \(4x(x - 6)\).
Factoring a Polynomial Model

**Helipads** A helicopter landing pad, or helipad, is sometimes marked with a circle inside a square so that it is visible from the air. What is the area of the shaded region of the helipad at the right? Write your answer in factored form.

**Step 1** Find the area of the shaded region.

\[ A_1 = s^2 \]  
Area of a square

\[ = (2x)^2 \]  
Substitute 2x for s.

\[ = 4x^2 \]  
Simplify.

\[ A_2 = \pi r^2 \]  
Area of a circle

\[ = \pi x^2 \]  
Substitute x for r.

The area of the shaded region is \( A_1 - A_2 \), or \( 4x^2 - \pi x^2 \).

**Step 2** Factor the expression.

First find the GCF:

\[ 4x^2 = 2 \cdot 2 \cdot x \cdot x \]
\[ \pi x^2 = \pi \cdot x \cdot x \]

The GCF is \( x \cdot x \), or \( x^2 \).

**Step 3** Use the Distributive Property to factor out the GCF.

\[ 4x^2 - \pi x^2 = x^2(4) + x^2(-\pi) \]
\[ = x^2(4 - \pi) \]

The factored form of the area of the shaded region is \( x^2(4 - \pi) \).

TEKS FOCUS

TEKS (10)(B)  Multiply polynomials of degree one and degree two.

TEKS (1)(C)  Select tools, including real objects, manipulatives, paper and pencil, and technology as appropriate, and techniques, including mental math, estimation, and number sense as appropriate, to solve problems.

Additional TEKS (1)(E), (10)(D)

VOCABULARY

- Number sense – the understanding of what numbers mean and how they are related

ESSENTIAL UNDERSTANDING

There are several ways to find the product of two binomials, including models, algebra, and tables.

Key Concept  Using an Area Model

One way to find the product of two binomials is to use an area model, as shown at the right.

This model shows that $(2x + 1)(x + 2)$ can be written in standard form as $2x^2 + 5x + 2$.

Problem 1  Multiplying Polynomials

Find the product $(2x + 1)(x + 5)$.

You can use algebra tiles to model the multiplication of two binomials.

How do you know which tiles to use?
- Place a blue $x^2$ tile in the product when the factors are two green $x$ tiles.
- Place a green $x$ tile in the product when the factors are a green $x$ tile and a yellow unit tile.
- Place a yellow unit tile in the product when the factors are two yellow unit tiles.

$2x^2 + 10x + x + 5$  Identify the terms modeled by the tiles.

$2x^2 + 11x + 5$  Add coefficients of like terms.
**Problem 3**

**Using a Table**

What is the simplest form of \((x - 3)(4x - 5)\)?

<table>
<thead>
<tr>
<th>Know</th>
<th>Need</th>
<th>Plan</th>
</tr>
</thead>
<tbody>
<tr>
<td>Binomial factors</td>
<td>Product of binomials</td>
<td>Use a table.</td>
</tr>
<tr>
<td></td>
<td>written in standard form</td>
<td></td>
</tr>
</tbody>
</table>

When you use the Distributive Property to multiply binomials, notice that you multiply each term of the first binomial by each term of the second binomial. A table of products can help you organize your work.

![Table]

When labeling the rows and columns, think of \(x - 3\) as \(x + (−3)\). Think of \(4x - 5\) as \(4x + (−5)\).

The product is \(4x^2 - 5x - 12x + 15\), or \(4x^2 - 17x + 15\).

**Problem 4**

**Using FOIL**

What is a simpler form of \((5x - 3)(2x + 1)\)?

\[
(5x - 3)(2x + 1) = (5x)(2x) + (5x)(1) + (−3)(2x) + (−3)(1)
\]

\[
= 10x^2 + 5x - 6x - 3
\]

\[
= 10x^2 - x - 3
\]

The product is \(10x^2 - x - 3\).
Applying Multiplication of Binomials

Multiple Choice A cylinder has the dimensions shown in the diagram. Which polynomial in standard form best describes the total surface area of the cylinder?

- **A** \(2\pi x^2 + 4\pi x + 2\pi\)
- **B** \(2\pi x^2 + 10\pi x + 8\pi\)
- **C** \(4\pi x^2 + 14\pi x + 10\pi\)
- **D** \(2\pi x^2 + 2\pi x + 10\pi\)

The total surface area (S.A.) of a cylinder is given by the formula \(S.A. = 2\pi r^2 + 2\pi rh\), where \(r\) is the radius of the cylinder and \(h\) is the height.

\[
\begin{align*}
S.A. &= 2\pi r^2 + 2\pi rh \\
&= 2\pi(x + 1)^2 + 2\pi(x + 1)(x + 4) \\
&= 2\pi(x^2 + 2x + 1) + 2\pi(x^2 + 4x + x + 4) \\
&= 2\pi(x^2 + 2x + 1 + x^2 + 5x + 4) \\
&= 2\pi(2x^2 + 7x + 5) \\
&= 4\pi x^2 + 14\pi x + 10\pi \\
\end{align*}
\]

The correct answer is C.

Problem 6

### Multiplying a Trinomial and a Binomial

What is the simplest form of \((3x^2 + x - 5)(2x - 7)\)?

\hline
2x - 7 \\
-21x^2 - 7x + 35 \\
6x^3 + 2x^2 - 10x \\
6x^3 - 19x^2 - 17x + 35
\end{array}
\]

Multiply by \(-7\).

Multiply by \(2x\).

Add like terms.

The product is \(6x^3 - 19x^2 - 17x + 35\).

**Problem 1**

**Simplifying a Rational Expression**

What is the simplified form of \( \frac{x - 1}{5x - 5} \)? State any excluded values.

\[
\frac{x - 1}{5x - 5} = \frac{x - 1}{5(x - 1)}
\]

Factor the denominator. The numerator cannot be factored.

\[
= \frac{x - 1}{5(x - 1)}
\]

Divide out the common factor, \( x - 1 \).

\[
= \frac{1}{5}
\]

Simplify.

The denominator of the original expression is 0 when \( x = 1 \). The simplified form is \( \frac{1}{5} \), where \( x \neq 1 \).
**Problem 2**

**Simplifying a Rational Expression Containing a Trinomial**

What is the simplified form of \( \frac{3x - 6}{x^2 + x - 6} \)? State any excluded values.

**Think**
- To see if there are any common factors, factor the numerator and the denominator.
- Divide out the common factor, \( x - 2 \). Simplify.
- State the simplified form with any restrictions on the variable.

**Write**
- \( \frac{3x - 6}{x^2 + x - 6} = \frac{3(x - 2)}{(x + 3)(x - 2)} \)
- \( = \frac{3(x - 2)^1}{(x + 3)^1(x - 2)^1} \)
- \( = \frac{3}{(x + 3)} \)

The denominator of the original expression is 0 when \( x = -3 \) or \( x = 2 \). So the simplified form is \( \frac{3}{x + 3} \), where \( x \neq -3 \) and \( x \neq 2 \).

**Problem 3**

**Recognizing Opposite Factors**

What is the simplified form of \( \frac{4 - x^2}{7x - 14} \)? State any excluded values.

**Plan**
- When should you factor \(-1\) from an expression?
  - You should factor \(-1\) from \( a - x \) when factoring \(-1\) results in a common factor.

**Think**
- Factor the numerator and the denominator.
- Factor \(-1\) from \(2 - x\).
- Divide out the common factor, \( x - 2 \).
- Simplify.

**Write**
- \( \frac{4 - x^2}{7x - 14} = \frac{(2 - x)(2 + x)}{7(x - 2)} \)
- \( = \frac{-1(x - 2)(2 + x)}{7(x - 2)} \)
- \( = \frac{-1(x - 2)^1(2 + x)}{7(x - 2)^1} \)
- \( = \frac{-x + 2}{7} \)

The denominator of the original expression is 0 when \( x = 2 \). The simplified form is \( \frac{-x + 2}{7} \), where \( x \neq 2 \).

**Shopping** You are choosing between the two wastebaskets that have the shape of the figures at the right. They both have the same volume. What is the height \( h \) of the rectangular wastebasket? Give your answer in terms of \( a \).

**Step 1** Find the volume of the cylinder.

\[
V = \pi r^2 h = \pi a^2 (2a + 8)
\]

Substitute \( a \) for \( r \) and \( 2a + 8 \) for \( h \).

**Step 2** Find the height of a rectangular prism with volume \( \pi a^2 (2a + 8) \) and base area \( B = (2a)^2 = 4a^2 \).

\[
V = Bh
\]

Solve for \( h \).

\[
h = \frac{V}{B} = \frac{\pi a^2 (2a + 8)}{4a^2}
\]

Substitute the volume of the cylinder for the volume of the rectangular prism and \( 4a^2 \) for \( B \).

\[
= \frac{\pi a^2 (2)(a + 4)}{4a^2}
\]

Factor.

\[
= \frac{\pi a^2 (2)^1 (a + 4)}{2a^2}
\]

Divide out common factors, \( 2 \) and \( a^2 \).

\[
= \frac{\pi (a + 4)}{2}
\]

Simplify.

The height of the rectangular prism is \( \frac{\pi (a + 4)}{2} \).

7-1 Adding and Subtracting Polynomials

Quick Review

A monomial is a number, a variable, or a product of a number and one or more variables. A polynomial is a monomial or the sum of two or more monomials. The degree of a polynomial in one variable is the same as the degree of the monomial with the greatest exponent. To add two polynomials, add the like terms of the polynomials. To subtract a polynomial, add the opposite of the polynomial.

7-2 Multiplying and Factoring

Quick Review
You can multiply a monomial and a polynomial using the Distributive Property. You can factor a polynomial by finding the greatest common factor (GCF) of the terms of the polynomial.

Example
What is the factored form of $10y^4 - 12y^3 + 4y^2$?

First find the GCF of the terms of the polynomial.

$10y^4 = 2 \cdot 5 \cdot y \cdot y \cdot y \cdot y$

$12y^3 = 2 \cdot 2 \cdot 3 \cdot y \cdot y \cdot y$

$4y^2 = 2 \cdot 2 \cdot y \cdot y$

The GCF is $2 \cdot y \cdot y$, or $2y^2$.

Then factor out the GCF.

$10y^4 - 12y^3 + 4y^2 = 2y^2(5y^2) + 2y^2(-6y) + 2y^2(2)$

$= 2y^2(5y^2 - 6y + 2)$

Exercises

28. The GCF of two numbers $p$ and $q$ is 5. Can you find the GCF of $6p$ and $6q$? Explain your answer.

7-3 and 7-4 Multiplying Binomials and Multiplying Special Cases

Quick Review
You can use algebra tiles, tables, or the Distributive Property to multiply polynomials. The FOIL method (First, Outer, Inner, Last) can be used to multiply two binomials. You can also use rules to multiply special case binomials.

Example
What is the simplified form of $(4x + 3)(3x + 2)$?

Use FOIL to multiply the binomials. Find the product of the first terms, the outer terms, the inner terms, and the last terms. Then add.

$(4x + 3)(3x + 2) = (4x)(3x) + (4x)(2) + (3)(3x) + (3)(2)$

$= 12x^2 + 8x + 9x + 6$

$= 12x^2 + 17x + 6$

Exercises

7-5 and 7-6 Factoring Quadratic Trinomials

Quick Review
You can write some quadratic trinomials as the product of two binomial factors. When you factor a polynomial, be sure to factor out the GCF first.

Example
What is the factored form of \( x^2 + 7x + 12 \)?
List the pairs of factors of 12. Identify the pair with a sum of 7.

<table>
<thead>
<tr>
<th>Factors of 12</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 12</td>
<td>13</td>
</tr>
<tr>
<td>2, 6</td>
<td>8</td>
</tr>
<tr>
<td>3, 4</td>
<td>7 ✓</td>
</tr>
</tbody>
</table>

\( x^2 + 7x + 12 = (x + 3)(x + 4) \)

7-7 Factoring Special Cases

Quick Review
When you factor a perfect-square trinomial, the two binomial factors are the same.
\[
\begin{align*}
    a^2 + 2ab + b^2 &= (a + b)(a + b) = (a + b)^2 \\
    a^2 - 2ab + b^2 &= (a - b)(a - b) = (a - b)^2
\end{align*}
\]
When you factor a difference of squares of two terms, the two binomial factors are the sum and the difference of the two terms.
\[
    a^2 - b^2 = (a + b)(a - b)
\]

Example
What is the factored form of \( 81t^2 - 90t + 25 \)?
First, rewrite the first and last terms as squares. Then, determine whether the middle term equals \( -2ab \).
\[
\begin{align*}
    81t^2 - 90t + 25 &= (9t)^2 - 2(9t)(5) + 5^2 \\
                      &= (9t)^2 - 2(9t)(5) + 5^2 \\
                      &= (9t - 5)^2 
\end{align*}
\]

Quick Review

When a polynomial has four or more terms, you may be able to group the terms and find a common binomial factor. Then you can use the Distributive Property to factor the polynomial.

Example

What is the factored form of $2r^3 - 12r^2 + 5r - 30$?

First, factor out the GCF from each group of two terms. Then, factor out a common binomial factor.

$$2r^3 - 12r^2 + 5r - 30 = 2r^2(r - 6) + 5(r - 6)$$

$$= (2r^2 + 5)(r - 6)$$

7-9 Simplifying Rational Expressions

Quick Review

A rational expression is an expression that can be written in the form $\frac{\text{polynomial}}{\text{polynomial}}$. A rational expression is in simplified form when the numerator and denominator have no common factors other than 1.

Example

What is the simplified form of $\frac{x^2 - 9}{x^2 - 2x - 15}$?

$$\frac{x^2 - 9}{x^2 - 2x - 15} = \frac{(x + 3)(x - 3)}{(x + 3)(x - 5)}$$

Factor the numerator and denominator.

$$= \frac{(x + 3)(x - 3)}{(x + 3)(x - 5)}$$

Divide out the common factor.

$$= \frac{x - 3}{x - 5}$$

Simplify.

Exercises

85. What fraction of the rectangle is shaded? Write your answer as a rational expression in simplified form.
Quick Review
You can divide rational expressions using the same properties you use to divide numerical fractions.
\[
\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} = \frac{ad}{bc}, \text{ where } b \neq 0, c \neq 0, \text{ and } d \neq 0.
\]
To divide a polynomial by a monomial, divide each term of the polynomial by the monomial. To divide a polynomial by another polynomial, use long division. When dividing polynomials, write the answer as quotient + \( \frac{\text{remainder}}{\text{divisor}} \).

Example
What is the quotient \((3x^2 - 10x + 3) \div (x - 3)\)?

\[
\begin{array}{c|c}
3x^2 - 10x + 3 & \hline \\
3x^2 - 9x & \\
3x - 9 & \hline \\
-x + 3 & \\
-x + 3 & \\
0 &
\end{array}
\]

The quotient is \(3x - 1\).
